

s50 Litterbin

care and maintenance guidelines

The s50 litterbin is constructed from zintec steel and zinc plated mild steel with a formed ABS aperture. It is finished in polyester powder, a plastic coating which is baked onto the components prior to assembly.

Maintaining the painted steel and ABS aperture

Clean the bin inside and out regularly using warm soapy water. Avoid the use of abrasive cleaners as they may damage the surface finish. Where the metal surface becomes damaged clean with a wire brush and or sand, prime with a zinc rich primer then paint with a spirit or synthetic based top coat. Omos recommends *Trimite* products. Contact their technical department for details of paint products and application techniques. For further advice contact Omos on + 353 45 899802.

Liner

The s50 litterbin is equipped with a 75L galvanized steel liner. To prolong the life of the liner Omos recommends using plastic bin liners. This will also prevent seepage of liquids onto the surrounding pavement.

Locks, hinges and other moving parts

All moving parts should be kept clean and lubricated to ensure a long life. A spray lubricant such as 'WD40' is widely available and well suited.
